

Georgian Recommendations

It is advised to employ Intesti Bacteriophage legally recognized medical preparation for prophylactic reasons during the spread of intestinal illnesses by adding the preparation into the wells.

Finally, it is advised to conduct a thorough scientific investigation that would address all the issues raised in order to determine the quality of drinking (well) water reservoirs in rural settlements, the status and cause of pollution, as well as to draw conclusions about the expediency of using bacteriophage preparations to reduce or prevent pollution (as well as which phage, prepared in what solution, in what quantity would be effective).

To obtain more pronounced results of phage treatment, further extensive and detailed research is needed to determine the leading bacteria polluting well water, against which it will be possible to prepare active phage preparations (in the synthetic field) and further use.
